

Saunum

technology

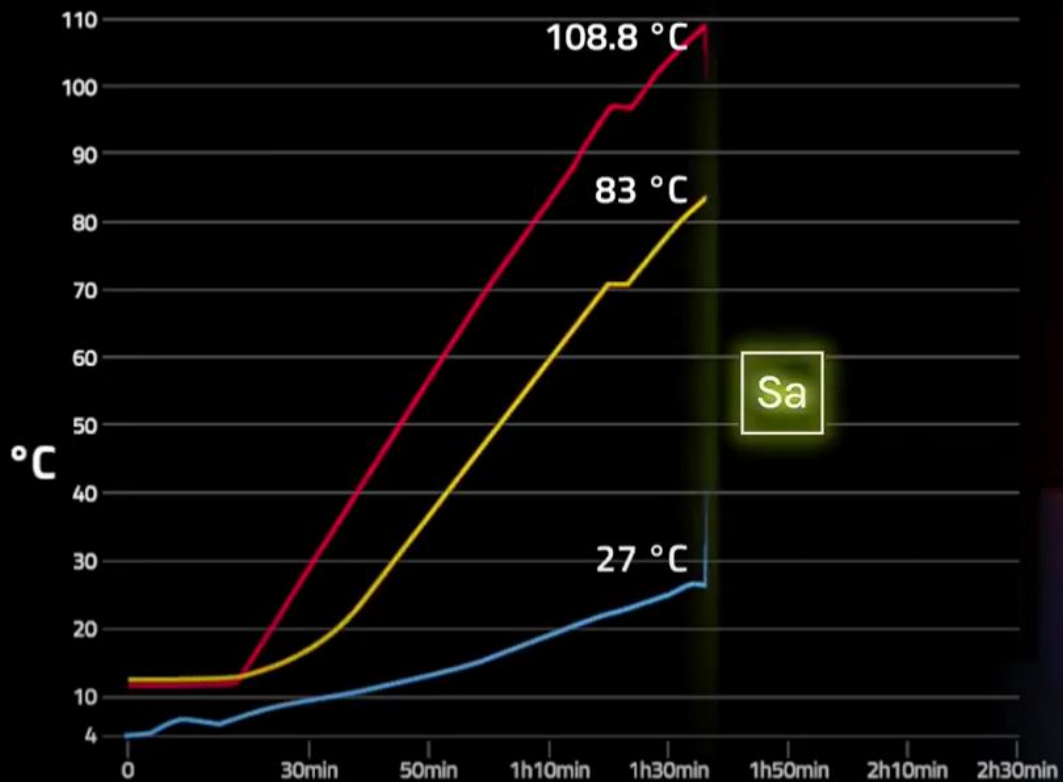

One of the main problems in a classic sauna is the unevenly distributed temperature: the upper air layers are too hot and the lower ones too cold. In addition, the lack of oxygen at almost the same height and the steam burning the skin make the sauna session a tiring and unpleasant experience.

Active sweating

The device of the sauna raises the humidity level of the steam room while equalizing the temperature in the air layers, and due to the more uniform temperature environment, the body starts sweating faster.

Salt ions

In addition to a more even temperature, Saunum's patented technology enriches the air in the steam room with salt ions, which clean the air, reduce physical ailments, heal the skin and improve sleep.

Sauna or personal spa ?

The following functions can be created with our devices (which are not allowed by other heaters):

- **steam sauna** (with uniform temperature and richer oxygen)
- **sanarium** (with uniform temperature and richer oxygen)
- **steam-rich sauna** (we can bring the relative humidity in the steam room to more than 60% with the device)
- **salt chamber** (thanks to Himalayan salt and patented salt spray method)
- **aroma sauna** (this is a new solution that we will introduce in the end of year 2021)
